TECHNOLOGY ASSET
ACQUISITION BRIEF

E-Com Review Intelligence Pro

Technical & Commercial Due Diligence Package

Browser-based E-commerce Intelligence & Wholesale Research

VERSION 1.3.0 | CHROME EXTENSION | MANIFEST V3

Prepared for prospective acquirers, SaaS founders, software companies, agencies and technology investors.

DOCUMENT ATTRIBUTE	DETAILS
Product	E-Com Review Intelligence Pro
Release	v1.3.0
Platform	Google Chrome / Manifest V3
Deployment	Client-side browser extension
Current backend	No mandatory external application backend
Current persistence	Chrome local storage
Acquisition format	Source-code project and associated assets, subject to agreed transfer terms

Document status: Preliminary technical and commercial assessment based on the product description and development history supplied for v1.3.0. This is not an independent source-code audit, penetration test, security certification or live-marketplace verification.

EXECUTIVE SUMMARY

E-Com Review Intelligence Pro is a browser-based research tool intended to consolidate customer review intelligence, competitor price observation, product discovery and wholesale supplier search into one workflow. It is designed for e-commerce sellers, wholesalers, distributors, agencies and product researchers.

The current standalone release provides a local-first foundation: marketplace-specific page interaction, review normalization and analysis, product-specific workspaces, sourcing search generation, price observations and CSV/XLSX exports. Core operation does not require a hosted application backend.

The acquisition opportunity is to obtain an existing browser extension and evolve it into a broader SaaS product with cloud synchronization, team workspaces, authorized data integrations, historical market intelligence and subscription monetization.

Assessment discipline

This package distinguishes existing functionality from proposed capabilities. Exact implementation, permissions, test coverage, selector reliability, licensing and performance must be verified against the delivered source code and target Chrome environment before any acquisition representation or warranty.

ASSET PROFILE

DIMENSION	CURRENT POSITION	COMMERCIAL IMPLICATION
Product form	Standalone Chrome extension, Manifest V3	Can serve as a browser tool and SaaS client.
Processing	Client-side JavaScript	Low infrastructure dependency for current workflows.
Persistence	Chrome local storage	Local research retention; cloud sync is future work.
Research scope	Reviews, market searches, price observations and sourcing links	Combined workflow can differentiate from single-purpose tools.
Commercial maturity	Functional product foundation; further validation required	Buyer can acquire and invest in hardening and expansion.

CONTENTS

1. Master Feature Specification & User Flow
2. Enterprise Technical Architecture Blueprint
3. Code Quality, Security & Scalability Audit
4. SaaS Commercial & Ramp-up Roadmap
5. Acquisition Opportunity & Transfer Scope

SECTION 1 — MASTER FEATURE SPECIFICATION & USER FLOW

1.1 Core value proposition

The product reduces the fragmentation of e-commerce research. Instead of separately reading customer reviews, categorizing complaints, comparing retail listings, searching wholesale marketplaces and preparing spreadsheets, users work from a single product-oriented browser workspace.

It is designed to help users answer five commercial questions: what customers say; which problems recur; how comparable products are priced; where alternative supply may be found; and whether an observed sourcing price could support a viable margin.

1.2 Feature matrix

A. Core review intelligence engine

FEATURE	TECHNICAL DESCRIPTION	BUSINESS VALUE
Review extraction	Marketplace-specific DOM adapters identify supported review cards and extract fields available in the rendered page.	Reduces manual review collection.
Normalization & deduplication	Records are standardized into a common structure and repeated records identified.	Creates consistent datasets.
Sentiment analysis	Client-side rules classify feedback as positive, neutral or negative.	Surfaces satisfaction patterns.
Complaint detection	Phrase and category rules identify recurring customer complaints.	Highlights product weaknesses.
Delivery/product separation	Text is categorized into logistics/packaging or product-performance themes.	Separates fulfilment issues from product defects.
Suspicious-pattern analysis	Repeated phrases, verification status and timing are assessed heuristically.	Flags patterns for human investigation.
Review velocity	Review timestamps are examined for concentrated activity windows.	Highlights unusual review activity.
Review summary	Structured summaries consolidate ratings and recurring feedback themes.	Reduces manual reading time.

Review coverage depends on supported page structures and content rendered in the browser. The extension should not be represented as guaranteed access to every historical review or as proof that a review is fraudulent.

B. Product and competitor intelligence

FEATURE	TECHNICAL DESCRIPTION	BUSINESS VALUE
Product identification	Reads supported product identifiers from marketplace URLs and page context.	Associates research with the correct product.
Product workspaces	Stores research separately by product identifier.	Avoids mixing research.
Title detection	Uses available product-page text to form product names and search queries.	Reduces manual entry.
Cross-marketplace search	Creates user-directed searches for comparable listings.	Speeds competitor discovery.
Price observation	Captures supported visible listing prices when available.	Builds evidence-based price records.
Price history	Stores dated observations from the point tracking begins.	Supports price movement analysis.
Popularity cues	Records explicit public purchase signals when exposed on supported pages.	Adds limited demand context.

C. Wholesale sourcing engine

FEATURE	TECHNICAL DESCRIPTION	BUSINESS VALUE
Title cleaning	Removes generic promotional and packaging terms from product search phrases.	Improves search relevance.

FEATURE	TECHNICAL DESCRIPTION	BUSINESS VALUE
IndiaMART search	Generates supplier-oriented searches, including indexed listing searches.	Helps discover Indian suppliers.
Alibaba search	Generates international manufacturer and wholesale searches.	Extends sourcing reach.
Quotation capture	Supports recording supplier prices and observations.	Enables quote comparison.
Supplier comparison	Organizes manually observed supplier information.	Supports sourcing decisions.

D. Dashboard, data and reporting

FEATURE	TECHNICAL DESCRIPTION	BUSINESS VALUE
Unified workspace	Groups review, market, sourcing and export functions in one interface.	Reduces tool switching.
Price history records	Retains product-linked observations and timestamps.	Creates a local history.
CSV/XLSX export	Serializes research records into spreadsheet formats.	Supports reporting.
Local persistence	Retains product workspaces in Chrome storage.	Allows users to revisit research.
Marketplace launcher	Provides an entry point from supported product pages.	Reduces workflow friction.

1.3 End-to-end user journey

STEP	USER ACTION AND SYSTEM RESPONSE
1. Install	User loads the extension in Chrome; Manifest V3 initializes the extension.
2. Discover	User opens a supported product page on Amazon.in or Flipkart.
3. Launch	User clicks Review Intelligence; the extension identifies product context and opens its workspace.
4. Analyze	Where supported, the content script reads review cards rendered in the page; records are normalized and analyzed.
5. Understand	Dashboard presents rating and sentiment metrics, recurring complaints, delivery/product categories and heuristic risk signals.
6. Compare	Market Research generates comparable-product searches and supports recording observed prices.
7. Source	Sourcing generates IndiaMART and Alibaba searches using a cleaned product query.
8. Decide and export	User evaluates observations and supplier quotes, then exports CSV/XLSX reports.

UX objective: one product context and one consolidated workspace. Full unattended collection, universal marketplace coverage and automated supplier verification are not current-release guarantees.

SECTION 2 — ENTERPRISE TECHNICAL ARCHITECTURE BLUEPRINT

2.1 Technology stack

TECHNOLOGY	RESPONSIBILITY	RATIONALE
Chrome Extension Manifest V3	Lifecycle, permissions, scripts and configuration.	Modern Chrome extension model.
Vanilla JavaScript	Extraction, analysis, sourcing, UI and data processing.	No mandatory framework runtime.
HTML5 / CSS3	Popup and injected workspace presentation.	Native browser rendering.
Content scripts	Interaction with supported marketplace page DOMs.	Contextual access to rendered information.
Service worker (where configured)	Background events and coordination.	Event-driven execution.
Chrome Storage API	Local product workspace persistence.	Native browser storage.
Blob / URL APIs	Client-side downloadable reports.	No server needed for file generation.
CSV / native XLSX generation	Spreadsheet exports.	Portable business output.

The current architecture avoids a mandatory external application server and cloud database. This reduces operating overhead for standalone use, but local browser storage is not a substitute for a shared, multi-user SaaS database.

2.2 Logical system architecture

Current client-side data flow

LAYER	COMPONENTS	ROLE
User interface	Popup launcher; injected workspace UI	Starts research and presents results.
Marketplace integration	Amazon.in / Flipkart content scripts	Reads supported rendered page information.
Business logic	Review extraction; analyzer; sourcing; price observation; exporter	Normalizes and processes research data.
Persistence	Chrome Storage API	Stores product-specific local workspaces.
Outputs / destinations	CSV/XLSX; Google search; IndiaMART; Alibaba	Exports records and opens user-directed research destinations.

The current architecture is client-side. External marketplaces and search destinations are not owned or controlled by the extension. The SaaS backend discussed later is a proposed future component, not part of the current release.

2.3 Module responsibilities

PROJECT AREA / FILE	RESPONSIBILITY	BOUNDARY
manifest.json	Declares extension metadata, scripts and permissions.	Extension configuration.
src/content/amazonScraper.js	Amazon-specific review extraction.	Marketplace adapter.
src/content/flipkartScraper.js	Flipkart-specific review extraction.	Marketplace adapter.
src/content/UIInjector.js	Creates and manages injected workspace UI.	Presentation layer.
src/modules/analyzer.js	Review metrics, classification and pattern analysis.	Analytical domain layer.
src/modules/sourcing.js	Product title cleaning and supplier search generation.	Sourcing domain layer.
src/modules/exporter.js	CSV/XLSX report generation.	Output/serialization layer.
src/popup/	Extension popup and entry interface.	Extension UI.

This layout supports a marketplace-adapter approach: source-specific extraction produces normalized records consumed by a shared analysis engine. Exact file paths should be reconciled with the delivered v1.3.0 folder during buyer code review.

2.4 Data schema and state management

Illustrative product workspace (logical representation, not a verified export of the exact persisted object):

```
{ "productId": "B0XXXXXXXX", "marketplace": "amazon.in", "productTitle": "Example Wireless Earbuds", "reviews": [], "priceHistory": [], "supplierObservations": [], "lastUpdated": "2026-11-04T00:00:00.000Z" }
```

A normalized review record may include a review identifier, author label, verification indicator, date, rating, text, sentiment, primary category and source. A price observation should include product ID, source, currency, price, timestamp and observation type. Supplier observations should distinguish an unverified search result from a quotation or independently verified supplier.

Current state management uses browser-local persistence and product-specific workspaces. Recommended SaaS evolution includes a repository abstraction, IndexedDB for larger local datasets, incremental synchronization, versioned APIs and tenant-aware cloud persistence.

2.5 Proposed SaaS architecture

COMPONENT	POSSIBLE TECHNOLOGY	PURPOSE
Backend API	Node.js / TypeScript	Business logic and service interfaces.
Database	PostgreSQL	Users, organizations, products, research and subscriptions.
Authentication	Firebase Auth, Auth0 or managed identity	Identity and account management.
Cache	Redis	Frequently accessed data.
Job queue	BullMQ or managed queue	Scheduled and long-running tasks.
Object storage	S3-compatible storage	Reports and larger data artifacts.
Hosting	AWS, Google Cloud or Azure	Managed application infrastructure.

Tenant isolation should be enforced at API and database access layers. Organization membership, roles and subscription entitlements should be checked server-side rather than trusted to the extension UI.

SECTION 3 — CODE QUALITY, SECURITY & SCALABILITY AUDIT

3.1 Security architecture

The local-first design performs core research processing in the browser and does not require research records to be sent to a central application server. This can reduce server-side data exposure and infrastructure complexity. It does not, by itself, establish regulatory compliance or security certification.

AREA	CURRENT DESIGN POSITION	BUYER REVIEW POINT
Data processing	Client-side JavaScript for core workflows.	Inspect data flows and external requests.
Persistence	Chrome local storage.	Review retention, deletion and storage limits.
Backend	No mandatory application backend.	No cloud identity or tenant controls implied.
Exports	Client-side file generation.	Validate output content and spreadsheet safety.
Marketplace access	Content scripts interact with configured pages.	Review current terms, permissions and collection behavior.
Supplier search	User-directed external searches.	External destinations have their own policies.

3.2 Permission minimization

A commercial release should apply least privilege. Candidate permissions may include storage, activeTab, scripting where needed, and narrowly scoped marketplace host permissions. The exact manifest must be inspected to confirm which permissions are required. Unrestricted access to unrelated sites should not be requested without a documented need.

3.3 Privacy and compliance

• Review Amazon and Flipkart terms and applicable restrictions on automated extraction; use official APIs, licensed datasets or authorized exports where required.
• Assess handling of reviewer names and other personal information, retention periods, deletion processes and user disclosures.
• For SaaS deployment, assess applicable Indian data protection requirements, including the DPDP Act and relevant rules, and obligations in other target markets.
• Review Chrome Web Store policies, permission disclosures, privacy disclosures and remote-code restrictions before distribution.
• Public visibility does not automatically grant permission to collect, republish or commercially redistribute third-party data.

3.4 Modularity and maintainability

The source is organized around functional responsibilities: marketplace extraction, analysis, sourcing, UI and export. The marketplace-adapter pattern helps isolate selector changes from the shared analysis engine. A commercial hardening pass should standardize message contracts, schema validation, error boundaries and automated regression fixtures.

Recommended patterns for the next engineering phase

• Adapter pattern: each marketplace translates page-specific structure into normalized records.
• Repository pattern: business logic accesses data through a storage abstraction.
• Event-driven messaging: components use documented, versioned message contracts.
• Component-oriented UI: dashboard sections maintain clear presentation and state boundaries.
• Domain separation: extraction, analysis, sourcing and export remain independently testable.

These are architectural recommendations and should not be interpreted as confirmation that a formal MVC, Pub/Sub or repository framework is already implemented throughout the codebase.

3.5 Performance engineering

AREA	APPROACH / TARGET	EXPECTED BENEFIT
Runtime footprint	Vanilla JS without mandatory framework runtime.	Reduced baseline overhead.
Local processing	Analyze available records in-browser.	Avoid network round trips.
Product state	Load the relevant product workspace.	Avoid unrelated dataset processing.

AREA	APPROACH / TARGET	EXPECTED BENEFIT
DOM access	Use targeted selectors and bounded scans.	Reduce unnecessary traversal.
Background work	Prefer event-driven, minimal wake-ups.	Lower idle activity.
Exports	Generate files client-side.	Avoid export server dependency.

Proposed acceptance benchmarks — not measured results

BENCHMARK	PROPOSED TARGET
Workspace initial render	Under 1.5 seconds
Analysis of 1,000 normalized reviews	Under 3 seconds
Analysis of 5,000 normalized reviews	Under 10 seconds
Idle CPU usage	Near zero
Unnecessary background network calls	Zero
Workspace isolation and export tests	100% pass rate in defined test suite

3.6 Technical limitations and risk register

AREA	CURRENT LIMITATION	MITIGATION / DILIGENCE ACTION
DOM reliability	Selectors can break when marketplace markup changes.	Regression fixtures, diagnostics and adapter maintenance.
Review coverage	Depends on rendered content and supported page behavior.	Assess authorized APIs and licensed providers.
Fraud scoring	Heuristic indicators are not proof of manipulation.	Expose evidence and validate against labelled data.
Price history	History begins when observations are recorded.	Introduce scheduled authorized observations.
Sales intelligence	Exact competitor sales are generally not public.	Use licensed market-intelligence data; label estimates.
Supplier verification	Search results do not establish legitimacy.	Add independent verification workflow.
Cloud collaboration	Not included in standalone local architecture.	Add identity, backend and tenant model.
Security certification	No formal certification established.	Independent security review and remediation.

Technical assessment: The asset is best positioned as a functional browser-based product foundation with a defined hardening and SaaS expansion path. Enterprise readiness must be demonstrated through code review, security testing, performance benchmarks and authorized data integrations.

SECTION 4 — SAAS COMMERCIAL & RAMP-UP ROADMAP

4.1 Commercial opportunity

The opportunity is to evolve a browser research utility into a centralized intelligence product. The strongest potential differentiation is the connection between customer feedback and sourcing: recurring complaints can inform alternative product discovery, supplier searches and product-quality decisions.

CUSTOMER SEGMENT	PROBLEM ADDRESSED	POTENTIAL VALUE
Marketplace sellers	Product selection and customer complaint research.	Product and review intelligence.
Wholesale distributors	Supplier discovery and price comparison.	Supplier and quotation research.
Dropshipping businesses	Product discovery and competitive pricing.	Product opportunity workflows.
Agencies	Repeatable client research and reporting.	Shared workspaces and reports.
Private-label brands	Understanding product weaknesses before sourcing.	Complaint intelligence and supplier comparison.
Importers / exporters	Comparing sourcing options.	Manufacturer discovery and cost research.

4.2 SaaS transition strategy

Recommended model: retain the Chrome extension as a contextual research client and add a cloud application for identity, collaboration, shared workspaces, historical datasets and billing.

PHASE	IMPLEMENTATION	OUTCOME
Foundation	Backend API, PostgreSQL, managed authentication and tenant model.	Secure shared application foundation.
Synchronization	Repository abstraction, sync service, conflict handling and workspace versioning.	Cross-device continuity.
Commercial controls	Subscription billing, entitlements, usage metering and invoices.	Recurring-revenue operations.
Intelligence services	Background jobs, authorized data integrations, price history and reporting.	Higher-value centralized analytics.

Suggested services

SERVICE	RESPONSIBILITY
Identity and access	Authentication, sessions, organization membership and role-based access.
Tenant management	Organization-level data isolation and permissions.
Ingestion	Authorized source connectors, user imports and validation.
Analytics	Review classification, topic analysis, price metrics and scoring.
Supplier intelligence	Supplier records, quotes, comparisons and verification workflow.
Billing and usage	Plans, subscription state, quotas, metering and payment events.
Reporting	Exports, scheduled reports and shared dashboards.

4.3 Proposed monetization tiers

The following prices are illustrative hypotheses for initial testing in India. They are not validated market rates, revenue forecasts or commitments.

PLAN	ILLUSTRATIVE PRICE	PROPOSED INCLUSIONS
Starter	■0 / month	Limited product workspaces, basic review analysis, manual price observations, basic supplier searches and limited exports.
Pro	■1,499 / month	Expanded workspaces, higher analysis allowance, complaint categorization, price history, competitor dashboards, quotation management and advanced exports.
Enterprise	■7,999+ / month	Multiple users, shared organization workspaces, role-based access, higher usage, API access where available, custom integrations and priority support.

Additional revenue may come from enterprise API subscriptions, white-label reports, custom agency workflows, premium research reports and paid integrations. Data licensing and provider costs must be reflected in gross-margin assumptions.

4.4 Twelve-month roadmap

QUARTER	PRIORITY	PLANNED DEVELOPMENT	MILESTONE
Q1 Months 1–3	Reliability	Refactor modules; formalize schemas; improve adapter diagnostics; regression testing; larger local storage; quotation records; independent security review.	Stable, documented browser research product.
Q2 Months 4–6	SaaS foundation	Backend API; authentication; PostgreSQL; tenant model; workspace sync; billing; usage tracking; web dashboard.	Private SaaS beta.
Q3 Months 7–9	Intelligence	Authorized data connectors; price-history dashboards; category comparisons; topic clustering; opportunity scoring; quotation comparison; watchlists.	Centralized intelligence platform.
Q4 Months 10–12	Enterprise	Organization analytics; roles; API; white-label reports; supplier CRM; integrations; observability; security assessment.	Enterprise evaluation-ready platform.

4.5 Commercial KPIs

KPI	PURPOSE
Monthly Active Users	Measures ongoing adoption.
Product workspaces created	Measures research activity.
Reviews analyzed	Measures analytical usage.
Price observations recorded	Measures price-intelligence engagement.
Supplier searches performed	Measures sourcing engagement.
Free-to-paid conversion	Measures monetization effectiveness.
MRR and ARPA	Measures recurring revenue and account value.
Churn and retention	Measures customer durability.
CAC and gross margin	Measures acquisition efficiency and profitability.

4.6 Competitive positioning

The proposed differentiation is the combined workflow: review analysis identifies customer pain points; competitor research contextualizes the market; price observations provide evidence of positioning; supplier searches help investigate alternatives; and exports support business decisions. The connection between customer feedback and sourcing is more commercially interesting than a review summarizer operating in isolation.

SECTION 5 — ACQUISITION OPPORTUNITY & TRANSFER SCOPE

5.1 Proposed asset transfer

The seller is open to discussing a transfer of the complete source-code project and associated assets, subject to mutually agreed scope, price, intellectual property terms and delivery conditions.

ASSET / DELIVERABLE	PROPOSED STATUS
Complete extension source code	Included in proposed source-code transfer; buyer to verify delivered inventory.
Manifest V3 configuration	Included.
Marketplace-specific modules	Included, subject to source review.
Review analysis engine	Included, subject to source review.
Sourcing and market research modules	Included, subject to source review.
UI, dashboard and visual assets	Included, subject to asset and license review.
CSV/XLSX exporter	Included, subject to output validation.
Installation documentation and changelog	Available project documentation to be delivered.
Exclusive IP assignment	Subject to negotiated written agreement and rights verification.
Post-transfer support	Negotiable.
SaaS backend and cloud infrastructure	Not included in the current standalone architecture.
Paying customers / recurring revenue	Not established by information supplied.
Third-party data licenses	Not included unless separately documented and transferable.

5.2 Recommended transaction process

STAGE	RECOMMENDED ACTIVITY
1. Initial interest	Confirm buyer objectives, intended use and acquisition scope.
2. Confidentiality	Execute an NDA where appropriate before sharing sensitive source details.
3. Technical review	Inspect source tree, manifest, dependencies, tests, data flows and supported browser behavior.
4. Rights review	Review authorship, third-party licenses, asset provenance and marketplace/data permissions.
5. Commercial negotiation	Agree valuation, included deliverables, support and transfer conditions.
6. Closing	Execute assignment and transfer documents; deliver agreed files and lawfully transferable assets.

5.3 Final technical and commercial assessment

E-Com Review Intelligence Pro is a browser-based product foundation that brings together customer review analysis, product research, competitor price observations, wholesale supplier discovery and spreadsheet reporting. Its local-first design offers a relatively low-infrastructure starting point for standalone use.

The strongest long-term direction is a cloud-connected platform that helps businesses understand customer dissatisfaction, compare product positioning, monitor authorized price data and investigate alternative sourcing opportunities in one research environment.

The proposed acquisition should be evaluated as the purchase of an existing software foundation plus the opportunity to invest in its next stage—not as the purchase of an already completed enterprise SaaS platform.

ACQUISITION DISCUSSIONS

The complete source-code project is available for acquisition discussions with interested SaaS founders, software companies, agencies, developers and technology entrepreneurs. Prospective buyers may request further information on source structure,

technical implementation, current capabilities, SaaS expansion options, transfer scope and ownership terms.

NEXT STEP
Discuss the proposed acquisition valuation, source-code transfer scope, intellectual property terms and any optional post-transfer technical assistance.

CONFIDENTIALITY & RELIANCE NOTICE

This document is intended for preliminary evaluation by prospective acquirers. It is based on product details and development history supplied by the seller and has not been independently audited. No representation is made that all described functions work across every marketplace page, that all review records can be collected, that external data can be lawfully accessed or redistributed, or that the proposed SaaS roadmap has been implemented. Performance targets, pricing and roadmap items are proposals, not measured outcomes or guarantees. Buyers should conduct independent technical, legal, privacy, security and commercial due diligence before entering into a transaction.
